

Conclusions of NASE cours in Bushehr, Iran

March of 2019

The meeting begins with a short introduction by local organizers. Different participants give their opinion about the course:

Before this program, I have read the book on Astronomy, but with these practical activities and models, I understood the astronomy and realized astronomy, which means I'm so grateful to NASE visitors.

I am a teacher (physics teacher) and I was looking for a formula. This program changed my vision, but now Not only did I understand the concepts very well, also learned how to train

People are different in learning, someone by seeing and some by hearing. But the simple way of your teaching, helped me a lot and was great for all people with any different method of learning

NASE opened my eyes for the whole of life. I teach mathematics for 21 years. But I realized in this course. Look at one more viewpoint. I learn with simple but functional methods, could teach everything. Can be taught by seeing and not just hearing

I enjoyed much of this course and realized that astronomy has no boundary

All the programs that I participated in was without any practical activity, and I always had problems with this, but I enjoyed NASE course a lot. Thanks.

I always wanted to teach astronomy practically, but I did not know how, after NASE course I know and thank you very much now.

I live in a village without a telescope and no means, and I always thought how to teach astronomy, but now, I know, I can teach with very simple methods and equipment.
