

Conclusions NASE course in Cluj, Rumania

September 2016

At the end of the NASE course in Cluj some participants commented:

- For a Chemistry teacher the course is very useful because there are parts which explain the planet's composition and the student can see the importance of Chemistry's study.
- The course emphasized the genesis and the evolution of Universe
- For a primary teacher – there are some simple models which can be repeated with the pupils: Sun's model, Distances model
- It's very important that the teachers participate to a such course because after this they understand more and they can explain **correct** to their students the astronomy's notions.
- The course is a provocation for the teachers which work with blind students. They can continue to make tactile objects so their students can imagine many astrophysical phenomena.
- The course is very suitable for teachers which didn't study astronomy in university. They can reproduce the experiments in classrooms and so their students will be familiarized with astronomy and will learn with pleasure it.
